DEFINITION
Anterior epistaxis is bleeding from the nostril. It is very common in childhood and is often associated with acute upper respiratory tract infection and allergic rhinitis.

- Anterior: 90-95% of the epistaxis from Little’s area from anterior nasal septum
- Posterior: 5-10% profuse bleeding from posterior ethmoidal artery
- Epistaxis before 2 years of age is unusual and may be associated with injury or serious illness.
- Epistaxis in children has no recognizable cause 90% of the time.

IMMEDIATE CONSULTATION REQUIRED IN THE FOLLOWING SITUATIONS
- Shock
- Aspiration
- Profuse bleeding
- Systemic illness that cause bleeding
- Unstable vital signs
- Compromised Airway Breathing Circulation (ABC)
- Posterior epistaxis

CAUSES
- Trauma and irritation
- Drying of nasal mucosa due to lack of humidity in environment
- Foreign body irritation
- Nasal tumour (rare)

PREDISPOSING AND RISK FACTORS
- Allergic rhinitis
- Deviated nasal septum
- Infection of the upper respiratory tract
- Local vascular lesions
- Nasal polyps
- Cocaine use (e.g., sniffing, huffing)
- Alcoholism
- Nasal spray use
- Systemic coagulopathies
- Drugs (warfarin, nonsteroidal anti-inflammatory drugs [NSAIDs])
• Hematological malignancies
• Hypertension
• Liver failure
• Uremia
• Blood dyscrasias (hemophilia, von Willebrand’s disease)

HISTORY
Enquire about the following:
• Exposure to one or more of the predisposing factors
• Is bleeding usually unilateral
• Profuse bleeding or blood-streaked nasal discharge
• Determine duration, amount and frequency of bleeding
• Use of anticoagulants, aspirin (ASA) products, or other medications such as topical nasal steroid sprays
• History of easy bruising or bleeding elsewhere (e.g., melena, heavy menstrual periods)
• Family history of bleeding disorders

PHYSICAL FINDINGS
• Examine client sitting up and leaning forward so that blood will flow forward
• Assess ABCs and vital signs
  o Blood pressure is usually normal unless bleeding is severe enough to cause loss of volume
  o Heart rate may be elevated because of fear or if bleeding is severe enough to cause loss of volume
• Inspect Little’s area (Kiesselbach’s plexus)
• If no bleeding, check posterior end of inferior turbinate
• Septal deformity or displacement may be present
• Bleeding from anterior portion of septum
• Inspect throat for posterior bleeding
• Sinuses may feel tender
• Examine for polyp, tumour, or foreign body
• Skin for petechiae, purpura, or pallor
• Abdomen for hepatosplenomegaly
• Lymphadenopathy

DIFFERENTIAL DIAGNOSIS
• Mild infection of nasal mucosa
• Dryness and irritation of nasal mucosa
• Nasal fracture
• Foreign body
• Tumour
• Tuberculosis
• Blood dyscrasias

COMPLICATIONS
Conditions
• Maxillary sinusitis
• Serous otitis media
• Conductive hearing loss
• In severe cases:
  o Shock
  o Aspiration
• Re-bleeding and need for transfusion
• Migraine
• Bleeding diathesis
• Clotting factor deficiencies
• Thrombocytopenia
• Polyps
• Topical steroid use
• Vascular malformation

INVESTIGATIONS AND DIAGNOSTIC TESTS
• Consider CBC, platelet count, PT/PTT in recurrent epistaxis where the suspected cause is other than mucosal drying
• INR if on warfarin
MAKING THE DIAGNOSIS
- Diagnosis is made clinically

MANAGEMENT AND INTERVENTIONS

Goals of Treatment
- Stop bleeding
- Prevent further episodes

Appropriate Consultation
- Refer to a physician/RN(NP) to rule out other pathologies if the problem is recurrent.
- If there has been trauma (e.g., a fist fight), it is important to rule out septal hematoma. Management of hematoma of the nasal septum is surgical and transport is necessary.
- Unable to stop bleeding
- Recurrent epistaxis

Non-Pharmacological Interventions
- Initial control by pinching the nose
- Pinch lower part of the nose (below nasal bone) to apply direct pressure to Little’s area
- Tilt head forward to facilitate clot formation and avoid post-nasal drainage

Pharmacological Interventions
If direct pressure alone is insufficient to stop the bleeding:
- Gently suction clotted blood from nose
- Use a vasoconstricting nose drop: Xylometazoline 0.1% drops (Otrivin). Soak a cotton ball with the solution; place the medicated cotton ball in the anterior portion of the nose; and press firmly against the bleeding nasal septum for 10-20 minutes.

If the above measure fails to control bleeding, nasal packing should be performed.

Nasal Packing:
Be aware of the complications of nasal packing:
ANTERIOR EPISTAXIS ADULT & PEDIATRIC

- Toxic shock
- Septal hematomas
- Septal abscess
- Sinusitis
- Pressure necrosis
- Neurogenic syncope during packing

Anesthesia and vasoconstriction:
- Soak a cotton ball in a solution of 1% lidocaine with EPINEPHrine (1:1000)
- Put 1-2 cotton balls into the bleeding nostril (if bleeding is not clearly unilateral, put cotton balls into both nostrils)
- Put a dry cotton ball at the external nares to prevent leakage and dripping
- Leave cotton balls in place for 10 minutes
- Remove cotton balls and then pack the nasal cavity with one-half inch ribbon gauze soaked in Vaseline, layered anteriorly to as far posteriorly as possible, starting at the nasal floor and going toward the nasal roof.
- Leave in place for 2-3 days
- Nasal tampons or Gelform, if available, are alternatives to ribbon gauze
- Provide appropriate analgesia for pain (e.g., acetaminophen)

Prevention of recurrent epistaxis
- Identify and correct causes that predispose to epistaxis
- Recommend non-prescription nasal lubricant (e.g., Secaris)
- Cauterization - refer to physician/RN(NP)/ENT

Client and Caregiver Education
- Recommend increasing room humidity with a humidifier.
- Recommend trying humidification of the nasal mucosa with saline drops applied bid-qid.
- Counsel client/caregiver about appropriate use of medication (dose, side effects, avoidance of overuse, etc.).
- Recommend avoidance of known irritants and local trauma (e.g., nose-picking, forceful nose-blowing).
Instruct client/caregiver about first-aid control of recurrent epistaxis. The client should sit up and lean forward, applying firm, direct pressure to nasal cartilage (not bones) for at least 5 minutes before checking if bleeding has stopped.

- Avoid nose-blowing or sneezing, or do so gently to avoid disrupting the clot.
- Avoid physical exercise or sports for at least 2 weeks.
- Avoid use of NSAIDs, hot dry climates, hot spicy foods or strenuous activity for few days.
- Advise client/caregiver to keep the child’s fingernails trimmed to avoid trauma from nose-picking.

Monitoring and Follow-Up

- Monitor ABCs if significant bleeding has occurred or is still occurring.
- Follow-up as necessary if current bleeding resolves with first-line treatment.

Referral

- See section Appropriate Consultation

DOCUMENTATION

- As per employer policy
